## Unit 2, S12, SLO2 - Implementation of Doubly Linked Lists

**1. To delete the last node, set the next pointer of the previous node to __.**
**Answer:** NULL

**2. To delete a specific node, update the previous node's next pointer and the next node's __ pointer.**
**Answer:** previous

**3. A doubly linked list can be traversed in both forward and __ directions.**
**Answer:** backward

**4. In C, the last node is identified when its next pointer is equal to __.**
**Answer:** NULL

**5. In a doubly linked list, the head pointer points to the __ node.**
**Answer:** first

**6. The previous pointer of the head node and the next pointer of the tail node should both be set to __.**
**Answer:** NULL

**7. When freeing a node in C, we use the function __.**
**Answer:** free()

**8. A doubly linked list avoids the need for a temporary pointer for backward traversal because of the __ pointer.**
**Answer:** prev

**9. While inserting after a given node, the new node's next pointer should point to the given node's __.**
**Answer:** next node

**10. In a doubly linked list, each node is connected in __ directions.**
**Answer:** two (both)
