Fill in the blanks A structure in C is defined using the struct keyword. The syntax to define a structure is: struct StructName { members }; To declare a structure variable at the time of definition: struct StructName { members } variable; Structure members are accessed using the . (dot) operator when using a structure variable. When using a pointer to a structure, members are accessed using the -> (arrow) operator. To declare a structure variable separately: struct StructName variable; To create a pointer to a structure: struct StructName *ptr; ■■■ The worksheet shows *struct StructName ____; , which is technically reversed. The correct C syntax is: struct StructName *ptr; To assign the address of a structure variable: ptr = &variable; Structures group different types of variables into a user-defined type. Structure definitions usually end with a semicolon ; Answers :
