Unit 3, S6, SLO1 - Stack Applications - Recursion

1. In recursion, each function call is stored in the ____.

Answer: call stack (system stack)

2. The ____ principle is followed by stacks.

Answer: LIFO (Last In, First Out)

3. Stack is used internally to implement ____ function calls.

Answer: recursive

4. Every recursive function must have a ____ condition to avoid infinite calls.

Answer: base

5. The process of returning from a recursive function happens in the ____ order of calls.

Answer: reverse

6. Each recursive call adds a new ____ to the stack.

Answer: activation record (stack frame)

7. ____ is a classic example of a problem solved using recursion and stacks.

Answer: Factorial / Tower of Hanoi / Fibonacci

8. The return address and local variables are stored in the function's ____.

Answer: stack frame

9. The system stack helps in managing ____ function calls during recursion.

Answer: nested

10. When the base case is reached, the stack starts to ____.

Answer: unwind (pop frames)
