Unit 2, S7, SLO2 - Singly Linked List – Implementation of Linked Lists

1. A linked list is a collection of ____, where each node contains data and a pointer to the ____.

Answer: nodes, next node

2. In C, the keyword ____ is used to define a node in a linked list.

Answer: struct

3. The pointer used to point to the first node of the linked list is called the ____.

Answer: head / START

4. The pointer in the last node of a singly linked list points to ____.

Answer: NULL

5. A node in a linked list typically contains two fields: ____ and ____.

Answer: data, next (pointer)

6. Dynamic memory allocation for a new node is done using the ____ function.

Answer: malloc()
