## **Unit 2, S8, SLO1 - Singly Linked List – Implementation of Linked Lists**

**1. To traverse a linked list, a \_\_\_\_ pointer is used to iterate through each node.**

**Answer:** temporary (PTR)

**2. To insert a node at the beginning of the linked list, update the new node's link to point to the \_\_\_\_.**

**Answer:** current head (START)

**3. After inserting a node at the beginning, the \_\_\_\_ must be updated to point to the new node.**

**Answer:** head (START) pointer

**4. To delete a node, it's important to \_\_\_\_ the memory after unlinking the node.**

**Answer:** free

**5. A \_\_\_\_ check should always be done before accessing a node's data through a pointer.**

**Answer:** NULL pointer

**6. Inserting a node at the end requires traversal until the node's \_\_\_\_ pointer is NULL.**

**Answer:** next
