## Unit 2, S9, SLO2 - Doubly Linked List - Introduction

1. In a doubly linked list, each node contains \_\_ pointers.

Answer: two (2)

2. The two pointers in a doubly linked list point to the \_\_ and the \_\_ nodes.

Answer: previous, next

3. The pointer to the next node in a doubly linked list is commonly called \_\_.

Answer: next

4. The pointer to the previous node in a doubly linked list is commonly called \_\_.

Answer: prev

5. In a doubly linked list, the previous pointer of the head node is always set to \_\_.

Answer: NULL

6. In a doubly linked list, the next pointer of the tail node is always set to \_\_.

Answer: NULL

7. Insertion at the beginning of a doubly linked list requires updating the \_\_ pointer of the old head node.

Answer: prev

8. Deletion of a node in a doubly linked list requires adjusting the pointers of its \_\_ and \_\_ nodes.

Answer: previous, next

9. Traversing a doubly linked list can be done in both \_\_ and \_\_ directions.

Answer: forward, backward

10. A doubly linked list allows for more efficient deletion operations compared to a \_\_ linked list.

Answer: singly
